## About the Khoo Teck Puat - National University Children's Medical Institute (KTP-NUCMI)

The KTP-NUCMI is the paediatric arm of the National University Hospital (NUH) in Singapore, and comprises the Departments of Paediatrics, Paediatric Surgery and Neonatology. It houses the national paediatric liver and kidney transplantation programmes as well as the chronic renal replacement programme for children. It is a tertiary institution equipped to provide comprehensive and specialised medical and surgical services for newborns, children and adolescents. Through a generous gift from the estate of Tan Sri Khoo Teck Puat for the advancement of paediatric patient care, education and research, KTP-NUCMI is undergoing major expansion to further enhance its standing as an international centre of excellence in paediatric healthcare. NUH Kids is the brand of the KTP-NUCMI.

Fetal Kidney Clinic  
for Expectant Parents

## **Have you been told that your unborn child may have kidney abnormalities? Are you worried and have many unanswered questions?**

We can imagine the fears and anxieties you may face. The Fetal Kidney Clinic is specially set up for expectant parents who have been told that their unborn child may have significant congenital kidney disease based on prenatal ultrasound scans and would like to find out more about possible tests, interventions and outcomes after birth.

### **Congenital abnormalities of the kidney and urinary tract (CAKUT)**

Abnormalities of the kidney and urinary tract are noted in about 1-2% of fetuses during prenatal ultrasound scans. About half of these are transient and resolve with time. Others are minor and will not affect your baby's life significantly, pretty much like having a big nose or an extra thumb. However, there are some abnormalities that may ultimately lead to significant problems after birth. Certain abnormalities involving obstruction of the urinary tract will require prompt evaluation and interventions after birth to preserve kidney health.

### **Abnormalities that may be detected in prenatal ultrasound scans**

- ◆ Dilation of urinary tract system
- ◆ Dilated kidneys
- ◆ Single kidney
- ◆ Absent or small malformed kidneys
- ◆ "Bright" kidneys
- ◆ Kidneys in abnormal positions

## **Who can attend this clinic?**

This clinic is for expectant parents who have been told that their unborn child may have significant abnormalities of the kidney and/or urinary tract based on prenatal ultrasound scans and would like to find out more about possible diagnosis, investigations, interventions and long-term outcomes after birth. The fetal anomaly scan at 18-24 weeks' gestation should have been performed. Follow-up scans in the later stages of the pregnancy may be advised by your obstetrician to evaluate the severity of the abnormalities. Your obstetrician can advise you regarding referral to this clinic.

## **What can this clinic offer?**

You will be counselled by a paediatric kidney doctor, and the consultation may also include a paediatric surgeon. Through detailed discussion, the doctors will provide information on the possible diagnosis and outcomes based on the prenatal ultrasound findings, and develop an individualised plan for evaluation and treatment after birth. We do not provide additional investigations or interventions to the unborn child. Counselling is solely based on the ultrasound findings done by your obstetrician. Follow-up plans may be arranged for the child after birth where necessary.

## **Contact Us**

For appointment, please contact your obstetrician for referral.

The referral form can be downloaded at [www.nuhkids.com](http://www.nuhkids.com)

For enquiries, email us at [ckc@nuhs.edu.sg](mailto:ckc@nuhs.edu.sg) or call **(65) 6772 4411**.

It is important to bring along all ultrasound scans and reports from your obstetrician. We accept referrals from local private or international medical institutions.
