Intravenous Urography is a specialised X-ray examination of the urinary tract which entails an injection of contrast medium (“dye”) into the blood vessels to render them “opaque” on the X-ray images.

What to Expect During the Procedure

After emptying your bladder in the toilet, you will be comfortably positioned on the X-ray couch. You will then be given an injection (usually in the arm) of the contrast medium. When the contrast medium is injected, you may feel a warm sensation in the body. Do not worry, this sensation will disappear within a minute, and the contrast medium will be passed out in your urine in 15 to 30 minutes.

A compression band will be applied over your abdominal region for about 10 to 20 minutes. The compression band is necessary for better visualisation of the kidneys.

During the procedure, several X-rays images will be taken at different time intervals. When taking these X-rays, the radiographer will instruct you to hold your breath for a brief 2 to 3 seconds.

At the later stage of the procedure, you will be asked to visit the toilet to empty your bladder again before taking the x-ray. Your co-operation is important for clear images to be taken.

You will be expected to spend approximately two to three hours at the imaging centre. While the procedure itself will take between 30 to 60 minutes (depending on individual’s medical condition), you are required to go through the pre and post procedure preparations. It is therefore advisable that you do not schedule other appointments within this period.

After the Procedure

You may resume normal activity after the procedure. Your doctor will advise you of the results at your next appointment.

Important Points to Note

- ✓ Please inform your referring doctor if you have **asthma, severe drug allergies, renal problems** or are taking a **diabetic medication** called **Metformin** (Glucophage).
- ✓ **Please inform us if you are breastfeeding or if there is a possibility you are pregnant.**

What Are the Risks

The main risks of the procedure are allergic reactions to the contrast agent and leakage of the contrast outside the vein. These risks are low and we will take all necessary precautions to minimise these risks. For any enquiries about the procedure, kindly approach any of our staff.
